

The Old Report

VOL. 1, NO. 001

2026-03-30

COVER STORY

A HashiConf art collab

A couple of months ago my friend Jana helped organize HashiConf Europe , and asked me to work on generating custom artwork for each of their speakers.

Monica Dinculescu

This was my first experience with creating art for someone else, and especially art that had to match someone else's artistic guidelines. I've said this before, but I live and nap by the idea that rules (and editing) are at the core of the artistic process and not having to do that myself was brilliant . I wanted to write a bit about it because a) I did a bunch of work that I'm really proud of and I never got to talk about it and b) I am vain and I want to talk about it.

This was the final poster:

And this is what we wrote about it on the card that accompanied it:

Enclosed you will find an art print made for you by generative artist and engineer Monica Dinculescu.

This individual print is unique to you and you alone, as Monica has incorporated your name, the title of your talk, and the color of the HashiCorp product that you are talking about at this year's conference.

Each cell in the grid has been randomly generated to contain either a letter from your name, or a pattern in the product color.

Cells located towards the middle of the grid are more likely to contain a letter rather than a pattern, and this likelihood decreases in the cells towards the edges.

This print is the only iteration of its kind. Were it to be generated again, it would look slightly different each time.

I print everything in my art store myself, because I sell very limited editions and third-party printing companies only make sense financially when you're printing in the several dozen. This does mean that sometimes I'll fight with my printer thinking that its colour profile is whack, only to discover that it was Doing Just Fine™ and my MacBook over-saturates things like it's an Instagram filter in 2011. Every day is a school day.

Here are all the prints drying on their totes profesh drying rack that is definitely not just a string I hung around in my office.

So, how did we get here?

id="v1-i-have-no-idea-what-you-want">v1: I have no idea what you want

The design team's requirements were clear and wonderful:

follow the conference guidelines: there is a set of product colours that can be used in very specific ways (either as a solid colour, a gradient, a grid of dots, hashed lines, and nothing else) and should be used to have a geometric grid feeling.

the art should be unique and somewhat meaningful to the speaker. Like, random shapes might look beautiful, but they have no immediate connection to the speaker or what they were talking about, and needing to explain it too hard takes away from the magic of someone making you your very own art.

When I think of geometric posters, I (and everyone who's ever looked at a design book) think of Bauhaus , and that's exactly where I started. Here's some iterations from this round:

Too Partridge-Family: I started with a basic Bauhausy sort of grid, but we felt that it looked too much like a grid of birds. Not all was lost, though; you can see this in a different style on the home page now!

Extremely Mondrian-y, divided grid of squares. Really boring.

Random paths on a grid. These are called Truchet tiles, and they're a pretty classic generative art approach. I thought this looked really cool by itself, but it didn't have a ton of connection with the speaker so we scrapped them early on.

Random shapes in random places. Too generic, kinda boring.

Random shapes in random places but channeling Suprematism. I LOVE this style and I would LOVE to use it again, and I very well might.

Grid of squares with some overlapped letters. This was one we liked because it had both a grid and the speaker's name, but it felt a bit too chaotic in this iteration. It honestly looks to me like I sneezed a bunch of letters on a grid.

At this point I also considered some data-based art, but I didn't have enough interesting data that I could aggregate based on a name and an abstract alone. Anyway, did you notice how a lot of the iterations in this bunch are fairly standard generative-art approaches? Like, nothing here was novel, and I intended it that way: I wanted to figure out what the team had in mind, and the only way I knew how to do that was to use some common language we all knew, which is "things we've seen before".

id="v2-grids-of-letters">v2: Grids of letters

What came out from the previous explorations was that they liked the letter grid the most, but not as it was. At this point I also learnt that a specific colour (like, blue) is associated with a particular product (in blue's case that product is Vagrant) that a speaker is giving a talk about. Each of these products have a primary and a slightly lighter secondary colour, which is why below you'll see I stopped mixing different product colours together.

Can we do something with that Mondrian-y grid, but make it less boring with textures? Answer: yes but not in a good way.

Can we do something with those random shapes in random places, but by also remembering the user has a name? Answer: no and let's never mention this horror again.

Enough of that; let's go back to our friend, the grid. Truchet tile blobs with letters. I vetoed this before even sending it over because it was serving very solid 70s lava lamp vibes. At this point I also went a bit mad looking at just Jana's name, so I branched out to another team member.

Grids of squares with letters. A bit boring, a bit "not a fan of cutting off letters on principle". This image is really good at showing the letter distribution algorithm that all the grids are using: it's mostly centered around the center horizontal line, and then spreads out randomly outwards and downwards from there.

Grids of Bauhaus-style quarter circles or letters. I kind of like this, but overall it still felt a bit too basic and too "classic Bauhaus".

Grids of triangles or letters. This one looks kind of nice, doesn't it? We thought so too.

You'll notice that all of these images are very similar looking. This was an extremely good sign for me because I knew we were on the right track, and in the cleaning up stage.

id="v3-bring-it-home">v3: Bring it home

We all loved the triangles the most, and in order to make them a bit spicier, I decided to vary the texture of the triangle. Remember, I was allowed dots and hatches too! So in the final version, each triangle can be one of the 2 colours belonging to the product, either hashed or filled. Bish, bash, bosh.

From here it was just a matter of designing the poster layout around it, and making sure I had a plan for when my random number pixel math wasn't quuuuuuuute good enough. Thankfully, dat.gui exists, and this is what I looked at while generating 50-ish posters:

id="would-i-do-this-again">Would I do this again?

Absolutely. I honestly loved every step of this. I worked with 3 amazing women from start to finish that had good instincts and were kind and supportive af. I got to think outside of a box I wouldn't have normally found myself in. I tend to obsessively listen to a new album for 100 hours and I exclusively listened to Jessie Ware for this project (and then, ironically, never again).

Most importantly, I made something that is in 46 humans' hands. I hope they liked it!!!

I would love to do this again, so if you're a conference or a company that thinks this was a cool idea and want to do this for your speakers or employees, send me an email! I've got way more ideas where this came from and nothing to do with them.

SUMMER SCHOOL 6: Trade & The Better Life

NPR Planet Money

International trade is the web of cross-border relationships that binds economies together. Because of trade we have access to cheaper, higher-quality goods, and we get to benefit from other countries' cultures. Economics tells us trade makes society, overall on average, better off, but that doesn't mean everyone wins. Today, the good and bad of trade through the eyes of workers in developing economies who make the things sold around the world. We follow them as they navigate the ever-shifting international trade environment. |At this Summer School, phones ARE allowed during class... Check out this week's PM TikTok! | Listen to past seasons of Summer School here .

FEATURES

When pull requests get tricky

Monica Dinculescu

Imagine this: you have forked a repo a long time ago and have since been in a happily committed relationship with the master branch, modifying files and committing from the hip.

In case you have doubts about the likelihood of this scenario, we're talking about my notwaldorf.github.com blog branch, which I forked from [holman/left](#). All my changes are on the master branch so that GitHub can do its magic gh-pages trick and just Make Things Work™. This could also happen for repos you've forked and mucked around with, but never thought you'd ever contribute to.

Because you're a good open sorcerer, you might, at some point, want to send a pull request to fix a thing in the original repo. If you're anything like I am, you are now in a bit of a terrible situation because your fork's tip of tree has advanced and diverged quite a bit from the upstream repo, so any pull requests you send out will be polluted with code that doesn't belong in them.

At this point, you probably have some regrets. Let's not dwell on them. Here's the set of steps that will help you navigate this minefield you find yourself in. They're not special; I just couldn't find them all in one place, and wanted a summary for the future. Kamal figured most of this out, because he is a git wizard, while I am, most definitely, not.

id="set-up-your-upstream">Set up your upstream

If git remote doesn't show you a branch called upstream , you need to add one:

id="set-up-a-clean-branch-for-your-fix">Set up a clean branch for your fix

Step into your tardis and branch from when you were last in sync with the upstream. In my case, this was when I initially created my fork. A dull perusing of git log or git reflog should point you to the right sha. Then,

id="get-your-changes-in">Get your changes in

Here you have two options. If your changes are tiny, or you know exactly what they are, you can just manually reapply them. And by that I mean copy paste the changes into the right files, like a barbarian. For the record, this is my preferred approach. I am a barbarian. I live in the git stone age.

Alternatively, you can go the fancy route with

This will look at the diff between master (which is in the future), and your working copy (we are in the past) and let you pick and choose individual hunks. Having taken a moment and appreciated how amazing this last sentence was, you can:

hit s to split the hunks into smaller hunks

hit y or n to pick or skip a hunk.

If you've touched any files, it would be a good time to do your familiar git add/git commit dance.

id="merge-the-upstream-changes-in">Merge the upstream changes in

id="-t-t-t-test-your-cha-an-ges-">♪ ♪ T-t-t-test your cha-an-ges ♪ ♪

id="upload-your-branch">Upload your branch

This is the last step. If you want, you can rename your branch before uploading it. I usually do, because my original branch names tend to be silly. After this, you can go and look at your branch in GitHub and be delighted with the progress you've made. Time to send out that pull request!

Hope this helped!

standard-article(title: [Week 6], author: [Monica Dinculescu], source-name: [Monica Dinculescu], images: (), paragraphs: ([I skipped week 5 because all I did in the panna cotta was watch 3 seasons of “how to get away with murder”. It's a terrible show and I'm not ashamed of it.], [What is up with that star codex thing? I can't believe there was a cult of assholes in tech I didn't know about. I'm obviously not surprised they existed, there's an asshole under every rock in tech; I'm just surprised I didn't know about it. I'm a person in the know! I have an invite to Dispo!], [I watched the #freebritney documentary and I think that a) the concept of a conservatorship for a grown ass 40 year old woman is fucked and b) her dad being a misogynistic asshole is 80% of the reason she's on one. Nobody put Kanye in a corner when he was going bonkers; we let him run for president and bought his shitty 20 minute long album to make fun of it and talked about how he prolly needs to take his meds but oh well, famous people amirite. But if a woman goes a bit bonkers and in the process shaves her head (we all know women aren't allowed to shave their heads), then suddenly she needs to be in a legal monetary prison for life? Rich people waste their money ALL the time, why is she the different one? Makes you think.], [I also think it's the cherry on the cake that because her dad is “managing” her estate she is essentially paying both for her lawyers to try to help her, and for the opposing lawyers to try to screw her.], [I've been working on a lot of generative art. This is good, because I'm making things and I want to open a store so people can put my things on their walls, but bad because when I make art and keep looking at it I end up violently hating it, and that spirals out of control into a “everything I do is basic and derivative” mood which tbh makes me feel like shit. I had a nice chat with @mrmrs who is 100x more talented than me but feels similarly about his art sometimes, so I felt very seen.], [We drove to Arizona this weekend. We are still doing nothing but now it's nothing around cactuses and the desert. I've been trying to find ways to get myself to move more, and I read in Alice's notes that she tried out geocaching, so I installed an app last night! I thought there would be like a geocache per state, but there's millions. There are 2 geocaches within a 2 mile walk! If there's no week 7 notes it's either because nothing happened or because I died trying to get to this cache. The halting problem is a hell of a thing.],), insert-map: (:), word-count: 474, edited-for-length: false, debug-mode: false,)

The New Leadership Structures that Unblock Innovation

Harvard Business Review

The ability of an organization to innovate over and over again, for the long term, depends on leadership structure, culture, and systems. That’s according to Harvard Business School professor Linda Hill, who has spent years researching the true drivers of innovation, taking lessons from the world’s most successful companies. She explains why today’s leaders need to shift from the focus on decision-making and producing to creating the conditions for collaboration, experimentation, and smart decision-making across teams, silos, and wider ecosystems. She shares examples from Mastercard, Pixar, and more and outlines some newly defined ways of looking at leadership roles: as Architects, Bridgers, and Catalysts. Hill’s new book is Genius at Scale: How Great Leaders Drive Innovation.
