Actor Taye Diggs has opened up about losing both his parents to cancer.

He is advocating for early cancer detection and encouraging others to take charge of their health.

Diggs discusses how his experience with his parents has affected his approach to health and fatherhood.

Actor Taye Diggs is best-known for his roles on TV shows like “All American” and “Private Practice,” and films like “Rent” and “The Best Man.”

Now, he’s talking about his personal experience with cancer and how early detection can make all the difference.

“It’s kind of positive and negative ... positive in that I want to make people aware, negative in that I have a personal connection to cancer,” Diggs told Healthline.

Diggs is raising cancer awareness and encouraging people to take control of their own health.

“Both my parents passed from various cancers and being a father, and loving being a father, I want to make sure that I spend as much time with him as possible and stick around here for as long as I can, and taking this early detection blood test for cancer was something that allowed me to just have peace of mind, knowing that I was kind of in the driver’s seat,” said Diggs.

The actor recently paired with Cancerguard , a blood test for people ages 50 or older that helps detect more than 50 types and subtypes of cancer before symptoms appear.

“It’s not a diagnosis, but it just lets you know if you should go and take a few more steps further just to see what other specific tests you should take,” noted Diggs.

Healthline spoke with Diggs about his loss and how it has changed his approach to his own health and fatherhood.

This interview has been edited and condensed for clarity and length.

Diggs values life, health more than ever

Diggs explained that his experience with his parents’ cancer was a wake-up call. He lost his mother to breast cancer and his stepfather to colon cancer .

“It almost forces you to look at things differently. [It] makes me value life and health way more than I did before,” he said.

He went on to say that he has been lucky with his health, and that made him feel invincible. Now he has seen that “bad” things can happen, and that opened his eyes. Diggs said that his son helps push him to go to the doctor and take care of his health.

“It gives you kind of a new perspective on life and health and sticking around. When you have people that you care about, you want to be around for them,” he said.

“So for me, after that, it’s become easy to do things like take early detective blood tests for cancer. It’s all of that, watching my [diet], exercising, all that stuff. Living is a luxury. And if, and if we can do everything we can, we should.”

Losing his parents changed his approach to fatherhood

Diggs told Healthline about his 17-year-old son, Walker, and how the experience of losing his parents affected his approach to fatherhood.

“I can’t help but just be aware. I realize now life doesn’t last forever. I realized the importance of parenting. I realized the importance of a solid, healthy, and honest relationship,” Diggs said.

“When I did lose my mother, that was a really tough blow. And when you’re in the midst of something like that, you don’t want to see any positives. I mean, I wouldn’t say I would want it to happen again, but I’m definitely a different person, and I’m definitely a better father, and I’m just more aware of who I am and what my relationships are.”

Why early cancer detection matters

According to a recent report by the American Cancer Society (ACS) , early detection through screenings has significantly improved the survival rates for many cancers, including:

breast

cervical

colorectal

prostate

lung

“We have better screening and better understanding of cancer prevention,” Anton Bilchik , MD, PhD, surgical oncologist, chief of medicine, and director of the Gastrointestinal and Hepatobiliary Program at Providence Saint John’s Cancer Institute in Santa Monica, CA, told Healthline in an earlier interview .

Research has shown that when cancer is detected early, treatment is more effective and survival rates improve dramatically.

“Mortality has everything to do with when you find the cancer in its growth trajectory,” Arif Kamal , MD, chief patient officer for the American Cancer Society, told Healthline in an earlier interview .

The ACS points out that this is why getting regular cancer screenings is so important.

Now he has seen that “bad” things can happen, and that opened his eyes.

GLP-1 Drugs Like Ozempic, Wegovy May Help Treat Anxiety, Depression

Healthline

New research suggests that GLP-1s could offer dual benefits for treating both metabolic and mental health issues. Catherine Falls Commercial/Getty Images

A new study found that people taking GLP-1 drugs like Ozempic and Wegovy had a lower risk of worsening depression and anxiety.

The participants also had fewer hospitalizations and required less sick leave from their jobs.

Experts say the drugs' effects on dopamine signaling and brain inflammation could account for the benefits.

It's too soon to recommend GLP-1s as a primary treatment for mental health disorders. Further clinical trials are still needed.

Researchers say people living with diabetes often face a higher risk of developing mental health conditions.

Now, a large national study from Sweden found that certain medications commonly prescribed for diabetes and weight loss — specifically GLP-1 receptor agonists like Ozempic and Wegovy — may also help reduce the risk of worsening mental illness in people with anxiety or depression .

The findings, published in the April issue of *The Lancet Psychiatry* , offer hope for dual benefits in treating both metabolic and mental health issues . While promising, the researchers caution that further clinical trials are needed.

Effects of GLP-1 drugs on mental health disorders

The study analyzed health data from 95,490 people in Sweden who were diagnosed with depression, anxiety, or both, and were also prescribed diabetes medications between 2009 and 2022.

The researchers focused on a class of drugs called GLP-1 receptor agonists . These medications help control blood sugar and reduce appetite by mimicking the body's natural GLP-1 hormone.

Four specific GLP-1 medications were examined: semaglutide (Wegovy , Ozempic , Rybelsus), liraglutide (Saxenda), exenatide (Byetta, Bydureon BCise), and dulaglutide (Trulicity).

The study compared periods when individuals were taking these medications to periods when they were not, using a “within-individual” design. This approach means each person acted as their own control, reducing the influence of factors like age, gender, or overall health that do not change over time.

Data were gathered from national electronic health registers, including hospital admissions, sick leave records, and

death registries, allowing researchers to track worsening mental health events.

The primary outcome was a composite measure that included psychiatric hospitalizations, extended sick leave for psychiatric reasons, hospitalization due to self-harm, or death by suicide.

Secondary outcomes examined worsening of depression or anxiety separately, substance use disorders , and self-harm incidents.

The study also compared GLP-1 receptor agonists with other second-line diabetes medications like empagliflozin (Jardiance), dapagliflozin (Farxiga), and sitagliptin (Januvia) to see how these medications stacked up against each other in terms of mental health effects.

Statistical models adjusted for time-varying factors such as the order and duration of medication use and concurrent treatment with other psychiatric or antidiabetic drugs.

The aim was to isolate the effects of GLP-1 receptor agonists on mental health as much as possible within the observational data.

Ozempic, Wegovy lower risk of worsening mental illness

Over an average follow-up of 5.2 years, about 23.5% of the cohort used GLP-1 receptor agonists, with semaglutide and liraglutide being the most common.

The study revealed that use of semaglutide was associated with a 42% lower risk of worsening mental illness compared to periods when the same individuals were not taking GLP-1 receptor agonists.

Liraglutide also showed a beneficial effect, though less pronounced, with an 18% reduced risk. In contrast, exenatide and dulaglutide did not show significant associations with mental health outcomes.

When looking at specific mental health conditions, semaglutide use was linked to significantly lower risks of worsening depression, anxiety, and substance use disorders. Liraglutide was associated primarily with reduced risk of worsening depression. Additionally, GLP-1 receptor agonists as a group were associated with a lower risk of self-harm.

Compared directly with other second-line antidiabetic medications, semaglutide was again associated with better mental health outcomes, suggesting its benefits extend beyond glucose control alone. The study also found that these associations held true even when accounting for factors such as sex and the type of mental health diagnosis at study entry.

Additionally, the reduced risk of worsening mental illness was reflected not only in fewer psychiatric hospitalizations but also in reduced sick leave due to mental health reasons, which has implications for work capacity and quality of life.

Ozempic, Wegovy lower risk of worsening mental illness Over an average follow-up of 5.

GLP-1s Combined With Healthy Habits May Improve Heart Health in Diabetes

Healthline

Combining GLP-1 drugs with a healthy lifestyle may reduce cardiovascular risks in people with diabetes. Image Credit: Witthaya Prasongsin/Getty Images

A recent study found that people with type 2 diabetes who used GLP-1 receptor agonists (GLP-1 RAs) in combination with healthy lifestyle habits had a reduced risk of major adverse cardiovascular events.

The findings show that GLP-1 RAs, when combined with healthy habits, independently improved heart health, though to varying degrees.

The researchers noted that lifestyle interventions remain pivotal in diabetes management and can amplify the benefits of GLP-1 RAs.

Type 2 diabetes is a growing health concern in the United States, overlapping with the obesity epidemic.

According to the Centers for Disease Control and Prevention (CDC) , 40.1 million people in the United States have diabetes, either diagnosed or undiagnosed. That is an estimated 12% of the population.

According to research from 2017 , the prevalence of diabetes will increase by 54% by 2030. This is an estimated 54.9 million people.

Type 2 diabetes can lead to various complications, including cardiovascular disease . This is the leading cause of death among people with diabetes.

A recent study published in The Lancet Diabetes & Endocrinology found that a combination of GLP-1 receptor agonists (GLP-1 RAs) and healthy lifestyle habits can reduce the risk of major adverse cardiovascular events (MACE) in people with type 2 diabetes.

“Our findings underscore that, even in the era of highly effective GLP-1 pharmacotherapy, lifestyle habits remain central to diabetes management and cardiovascular risk reduction and can substantially amplify the benefits of modern medications,” Frank Hu , MD, Fredrick J. Stare Professor of Nutrition and Epidemiology and chair of the Department of Nutrition at the Harvard T. H. Chan School of Public Health, and corresponding author of the study, said in a press release .

GLP-1s and 6 healthy habits lower cardiovascular risk by 43%

The study used data from the Veterans Affairs’ Million Veteran Program from 2011 to 2023.

The researchers looked at the lifestyle habits, GLP-1 RA usage, and cardiovascular outcomes of over 98,000 adults who had type 2 diabetes and no previous history of cardiovascular disease.

The researchers considered 8 healthy habits:

healthy diet

regular exercise

not smoking

restful sleep

minimal alcohol consumption

good stress management

social connection and support

not having opioid use disorder

The MACEs they considered were:

non-fatal stroke

myocardial infarction (heart attack)

cardiovascular death

The study found that using a GLP-1 RA and maintaining a healthy lifestyle significantly reduced the risk for MACE.

“We know that GLP-1 receptor agonists can improve cardiovascular health in patients with diabetes. We also know that good lifestyle habits such as eating [a] heart-healthy diet, getting regular physical activity, and getting enough quality sleep, are all beneficial in controlling the risk factors that lead to heart disease,” Cheng-Han Chen , MD, board certified interventional cardiologist and medical director of the Structural Heart Program at MemorialCare Saddleback Medical Center in Laguna Hills, CA, who was not involved in the study, told Healthline.

“It is thus not surprising that combining both GLP-1 receptor agonists and healthy lifestyle modifications can have additive beneficial effects.”

Individuals who used a GLP-1 RA and adhered to between six and eight healthy habits showed a 43% lower risk of MACE than those who did not use a GLP-1 RA and adhered to three or fewer habits.

Those who adhered to all eight healthy habits had a 60% reduced risk compared to those who adhered to only one or fewer. Finally, people who used a GLP-1 RA had a 16% lower MACE risk than those who didn’t.

“From a public health perspective, the results underscore the continued importance of population-level investments and policy in promoting healthy diet, physical activity, sleep, stress management, and social connection, even in a modern drug era,” Hu said in the press release.

“As novel therapies expand, scalable lifestyle interventions remain essential for reducing the overall burden of cardio-

Bye-Bye Bites: 14 Ways to Get Rid of Mosquito Bites Overnight

Greatist

Wondering how to get rid of mosquito bites overnight? Discover simple home remedies for quick relief. From crushed ice to aloe vera, explore easy solutions to soothe itching and inflammation for a peaceful night's sleep.

If you're caught without bug bite cream or ointment, don't worry — plenty of simple home remedies can provide quick relief. From soothing aloe vera to the calming effects of oatmeal, discover easy solutions to alleviate itching and inflammation so you can sleep peacefully.

crushed ice

heat

aloe vera

baking soda

basil

vinegar

onion

thyme

peppermint oil

lemon balm

witch hazel

arnica

chamomile tea

garlic

Crushed ice

Just as you'd ice an injury, icing a bug bite can help decrease inflammation and temporarily numb the pain.

If icy cold treatments aren't your vibe, you can apply heat instead to soothe your bump.

Aloe vera

Aloe vera gel does more than soothe sunburns! It can also help ease bug bites and help them heal.

Baking soda

Baking soda can remove the itch. To make a paste, mix 1 tablespoon of it with a splash of water (not too much). Apply it to your bite as you would zit cream. Keep it on for 10 minutes before rinsing it off.

Did you know basil (yes, like the kind in your pasta) has a rich history as a skin infection remedy? It contains antioxidants that may bring down bug bite inflammation.

To whip up your own basil rub, boil a couple cups of water with 1/2 ounce of dried basil leaves. Cool the mixture before applying it to a washcloth and gently massaging it onto the bite for sweet relief.

You already know apple cider vinegar (fermented liquid from apples) is a huge player in the natural remedy world.

Some people use it to clean due to its antimicrobial effects, and others mix it into food or drinks for its possible health benefits (like helping with blood sugar issues).

Its beauty with bites is that it can help ease burning or stinging while disinfecting your scratchy little bump.

Onion juice (while not delicious) has antifungal and antibacterial properties, which could possibly help ward off infection. Plus, it could make your bite sting less. Just dab a bit of raw onion juice onto your bites. The downside? We're not sure how well it works ... and it's kinda stinky.

Thyme has been used to help with skin concerns for a long time. You can use it to help decrease irritation by chopping it up and applying the teeny leaves directly to your bite for 10 minutes. You can also boil thyme, soak a cloth in the cooled liquid, and wrap it around your bite.

Peppermint oil

Peppermint oil may work as an anti-itch agent. Mix it with carrier oil (like olive oil) before applying it to your skin, though!

Lemon balm

Another natural anti-itcher and astringent, lemon balm, may be helpful. You can either apply a lemon balm cream or chop up the leaves and apply them right to the bite.

Witch hazel

Witch hazel is a natural wonder with many uses for skin concerns such as acne and psoriasis. It can tackle inflammation and burning while helping your bug bite heal.

This herb may work, but the science is a little dicey. On its own, arnica is toxic, so any over-the-counter products you find have been carefully diluted for your safety.

Chamomile tea

The yummy tea that calms and soothes at bedtime has many other uses, including potentially calming an irritated bug bite. Steep the tea bag for 20 minutes before squeezing it out and applying it to your bite once it's cooled.

Blend minced garlic with petroleum jelly or fragrance-free lotion. Place the mixture on your bite for 10 minutes before

Ultraprocessed Foods As Addictive As Tobacco, Researchers Say

Healthline

New research shows that ultraprocessed foods may be as addictive as cigarettes. Image Credit: Alexander Spatari/Getty Images

A recent review found that ultraprocessed foods (UPFs) may be as addictive as tobacco products.

The researchers found that UPFs are designed to heighten reward and accelerate the delivery of reinforcing ingredients.

The “addictive” quality of these foods means they drive compulsive consumption and disrupt appetite regulation.

The review authors suggest that ultraprocessed foods should be subject to regulations similar to those for tobacco products.

Currently, there is no single universal definition of ultra-processed foods. Some people define them as foods that contain ingredients you would not find in your kitchen cupboards, such as emulsifiers and additives.

Many professionals use the NOVA classification to define ultraprocessed foods. This talks about foods that contain “formulations of ingredients, mostly of exclusive industrial use, typically created by a series of industrial techniques and processes.”

A recent review published in The Millbank Quarterly suggested that ultraprocessed foods may be as addictive as tobacco products.

“I agree with this study, as ultra-processed foods are specifically engineered to be highly appealing to most individuals,” Mir Ali, MD, bariatric surgeon and medical director of MemorialCare Surgical Weight Loss Center at Orange Coast Medical Center in Fountain Valley, CA, who was not involved in the research, told Healthline.

Research from 2023 estimates that over 73% of the foods in the United States are ultraprocessed.

“Cigarettes and UPFs [ultraprocessed foods] are not simply natural products but highly engineered delivery systems designed specifically to maximize biological and psychological reinforcement and habitual overuse,” noted the new study’s research team from Harvard, Duke, and the University of Michigan.

Are ultraprocessed foods addictive?

The review synthesized findings from addiction, public health history, and nutrition in order to identify sensory and structural features that increase the reinforcing potential of both cigarettes and ultraprocessed foods.

“Not everyone is ‘addicted’ to these foods, but for a meaningful minority, they trigger classic addiction-like patterns: strong cravings, loss of control, and continued use despite negative health effects,” said Michelle Routhenstein, preventive cardiology dietitian at EntirelyNourished, who was not involved in the study.

“These foods are deliberately engineered with refined carbs, added fats, salt, and flavor enhancers to maximize reward and repeat consumption, and the industry uses aggressive marketing tactics, especially targeting children,” she told Healthline.

The researchers focused on five key areas:

delivery speed

hedonic engineering, or designing foods to be irresistibly good

dose optimization

environmental ubiquity

deceptive reformulation, or “health washing”

They found that, like cigarettes, ultraprocessed foods are fine-tuned to deliver the right dose of sugar.

“Refined carbohydrates stimulate dopamine release via the vagus nerve, whereas fats do so through intestinal lipid sensing,” the researchers wrote.

“... UPFs with high levels of refined carbohydrates and added fats are some of the most potently rewarding substances in the modern diet. Notably, this refined carbohydrate-fat combination is almost nonexistent in nature.”

The way these foods rapidly deliver “feel-good” chemicals to the brain makes them potentially addictive, similarly to cigarettes.

The review noted that while cigarettes are engineered to deliver nicotine quickly, ultraprocessed foods are engineered to rapidly digest and absorb, as they typically have little to no fiber. This makes it easier for the body to process fat and sugar more quickly.

The researchers also explain that ultraprocessed foods give intentional flavor bursts that fade quickly and textures that melt in your mouth. This all helps to deliver more dopamine and encourages you to eat more.

‘Health washing’ in cigarettes, ultraprocessed foods

According to the review, both the tobacco and food industries have long used a strategy called “health washing.”

This is where products are marketed and reformulated to create an illusion of reduced harm while preserving the core of their addictive properties.

'Grey's Anatomy' and 'Euphoria' Star Eric Dane Dies at 53 After ALS Diagnosis

Healthline

Actor Eric Dane has died from amyotrophic lateral sclerosis (ALS) at the age of 53.

He had first announced his ALS diagnosis only 10 months prior.

The actor became a strong advocate for research following his diagnosis.

The disease is not curable, but there are treatments that can slow its progression.

There are also treatments that can improve function and comfort for patients.

Actor Eric Dane died on Thursday, February 19, 2026, after a "courageous battle" with amyotrophic lateral sclerosis (ALS), according to an announcement on his official Instagram account.

"He spent his final days surrounded by dear friends, his devoted wife, Rebecca, and his two beautiful daughters, Billie and Georgia, who were the center of his world," the post read.

It additionally spoke of his advocacy for awareness and research.

Although not mentioned in the post, Dane had partnered with I AM ALS and its Push for Progress initiative, which aims to raise money to accelerate research and expand access to promising new treatments.

Dane also lobbied for the extension of the Accelerating Access to Critical Therapies for ALS Act. This law, which was passed in 2021, provided five years of funding for research and allowed early access to ALS treatments. It is set to expire in 2026, according to reporting from CNN.

The 53-year-old star, best-known for his roles as Dr. Mark "McSteamy" Sloan on "Grey's Anatomy" and Cal Jacobs in "Euphoria," first revealed his diagnosis 10 months prior to his death.

In an interview with People at the time, Dane said, "I feel fortunate that I am able to continue working and am looking forward to returning to the set of Euphoria next week."

However, it appears that he did not have as much time left as he had hoped. "[H]is illness progressed far more quickly than anyone could have imagined," the announcement said.

What is amyotrophic lateral sclerosis (ALS)?

Rab Nawaz Khan, MD, a board certified neurologist who is a consultant at MyMSTeam, told Healthline that ALS is a progressive disease that damages motor neurons, the nerve cells that control voluntary movement.

You might also hear it referred to as "Lou Gehrig's disease," due to it becoming widely known after it was diagnosed in baseball player Lou Gehrig.

"The earliest symptoms are often focal weakness, like hand clumsiness, foot drop, tripping, trouble with buttons, or a change in speech clarity," said Khan. "Many people also notice muscle cramps, twitching, and muscle thinning in the affected area."

As the disease progresses, weakness can spread to other regions, he noted, affecting walking, arm function, speech, and swallowing.

Eventually, the person's breathing muscles weaken, leading to symptoms such as poor sleep, morning headaches, and shortness of breath with activity.

"Sensation is usually preserved," Khan added, "so numbness and tingling are not typical ALS features, and a subset of patients can have changes in thinking or behavior."

The National Institute of Neurological Disorders and Stroke (NINDS) adds that ALS can happen at any age, although it's more common between the ages of 55 and 75. Younger men are more likely than younger women to develop ALS, although women catch up as they grow older.

Non-Hispanic white people are most likely to develop the disease. The agency additionally notes a poorly understood link between military service and ALS.

Around 10% of all ALS cases are due to a genetic mutation, according to NINDS.

How is ALS treated?

Khan said that ALS is not yet curable, although there are treatments that can moderately slow its progression. There are also interventions that improve comfort and function.

"Disease-targeted medications include riluzole and edaravone, which can slow decline in certain patients, and a gene-targeted therapy is available for a specific inherited form related to SOD1," he explained.

However, Khan said the biggest impact often comes from multidisciplinary ALS care, where breathing, nutrition, mobility, and communication are addressed early and proactively.

"Noninvasive ventilation can improve sleep, energy, and quality of life when breathing muscles weaken, and cough assist devices help clear secretions," he said.

"Nutrition support, speech therapy, communication devices, physical and occupational therapy, and symptom-
