

The Pacific Report

VOL. 1, NO. 036

2026-03-30

COVER STORY

CodeSOD: A Little Twisted

Dana sends us a WTF that'll turn your head. She was shopping for new hard drives, and was doing it from her phone, a fairly reasonable tool to use for online shopping these days.

Remy Porter · The Daily WTF

She opened the website of one vendor, and it was rotated 90 degrees. Or half-pi radians, for those of us that are more used to sensible units.

This was irrespective of any rotation settings on her phone, the website insisted on showing itself in landscape mode. This created quite the unusual appearance when she held her phone in portrait orientation: the browser chrome surrounding the content was in portrait mode, but the page itself was in landscape.

Obviously, this is a terrible design choice. But Dana wanted to know more. So she started digging in. There was no sign of this behavior on a desktop, which sure, I'd hope not. Attempting to use wget to download the page caused a 403. Using curl downloaded a JavaScript challenge. Fine, they didn't want bots, but Dana wasn't a bot.

Poking around in the network tab of the desktop browser's debugging tools helped Dana learn a few things. First: the line endings in the files were all CRLF, implying that all development happened on Windows machines. Maybe that's not interesting, but in 2026, it feels unusual. Second, the page is setting a PHPSESSID cookie, so clearly the backend is written in PHP. But most important, Dana is able to piece together what she needs to successfully use curl to download the page, once pretending to be a desktop browser, and once pretending to be a mobile browser. With that, she ran a diff to see what changed.

The desktop version started with 42 blank lines. The mobile version started with 41. The rest of the pages were substantially the same, with two exceptions. First, the mobile page also added a stylesheet called stylesheet-responsive.css. I assume that name was chosen because irony is dead; nothing about this site is responsive. Second, there was a subtle difference in the body tags.

You see, both pages had a body tag like this:

But the mobile page, continued from there:

Yes, the mobile version has two body tags.

Dana writes:

Even though I don't have access to the real PHP source-code, I can imagine what it looks like.

Somewhere in that PHP source-code there is browser-detection (or rather browser-sniffing) and that toggles if it should serve a slightly different HTML code to the user. I do not want to work for that website, I do not want to look at that backend source-code. And I have to feel sorry and respect for the browser developers, as they have to write software that can handle completely broken HTML.

While I hate the results, the fact that the HTML specification originally required clients to render even the most broken HTML is arguably a really good design choice. Expecting people to do the right thing never works out for you.

Let's not forget their "responsive" CSS, which is obviously worth looking at, even if it's obvious what it must be:

```
@media only screen and ( orientation :portrait)
{ #landscape_mode_only { height : 98vw ; -webkit- transform : rotate ( 90deg ); -moz- transform : rotate ( 90deg ); -o- transform : rotate ( 90deg ); -ms- transform : rotate ( 90deg ); transform : rotate ( 90deg ) } }
```

This forces everything in the body to rotate sideways.

Look, actually responsive design is hard. But “just force the page into landscape mode no matter what the user does” is definitely not the solution .

And Dana points out one last thing:

As a cherry on the top, observe how the comment that marks the end of the header is placed after the starts. Which is wrong already, but also stupid, because already marks the end of the head. And the head is not really the header.

[Advertisement] BuildMaster allows you to create a self-service release management platform that allows different teams to manage their applications. Explore how!

Jupiter's Lightning May Have the Force of Nuclear Weapons

EditorDavid · Slashdot

How powerful is Jupiter's lightning? Thick clouds cover the view, notes Science magazine. But using an instrument on NASA's Juno spacecraft (orbiting Jupiter for the past decade), researchers determined Jupiter's lightning bolts are 100 to 10,000 times more energetic than earth's:

A single bolt of lightning on Earth releases about 1 billion joules of energy. That means the most extreme bolts of jovian lightning carry 10 trillion joules of energy, equivalent to 2400 tons of TNT, or one-sixth the power of the atomic bomb dropped on Hiroshima, Japan. Based on the rates of flashes seen by Juno, storms on this tempestuous world can unleash the force of multiple nuclear weapons every minute...

The four storms Juno studied were monstrous, says Michael Wong, a planetary scientist at the University of California, Berkeley and one of the study's authors. There were three flashes per second on average, often emerging from the hearts of storms that are 3000 kilometers across, longer than the distance from New York City to Denver. The researchers used the Hubble Space Telescope (and photographs from Juno's camera) to track Jupiter's storms with such precision that their radiometer could then pick out individual lightning flashes, according to the article.

"It's just a massive ball of gas. It makes sense that there's very energetic lightning happening," says Daniel Mitchard, a lightning physicist at Cardiff University who wasn't involved with the new study. But confirming such suspicions "is exciting," he says, because lightning plays an important role in forging complex chemistry — including the sort that primordial life is built on.

Thanks to Slashdot reader sciencehabit for sharing the article.

Read more of this story at Slashdot.

It makes sense that there's very energetic lightning happening," says Daniel Mitchard, a lightning physicist at Cardiff University who wasn't involved with the new study.

FEATURES

Step-by-Step Guide to Apply for a Business Loan

Jessica Clark · Small Business Trends

Applying for a business loan can seem intimidating, but breaking it down into manageable steps simplifies the process. Start by comprehending the types of loans available and evaluating your specific funding needs. Reviewing your credit score and financial health is essential, as these factors influence your eligibility. Gathering the right documentation and completing the application accurately can greatly improve your chances of approval. Ready to learn what comes next after you submit your application?

id="key-takeaways">Key Takeaways

Identify your business needs and determine the exact funding amount required for expansion, operations, or equipment purchases.

Assess your eligibility by reviewing your credit score, business longevity, and financial health, ensuring you meet lender criteria.

Compare lenders and loan options, evaluating interest rates, repayment terms, and additional fees to find the best fit.

Gather necessary documentation, including financial statements, personal information, and a business plan, to support your application.

Complete and submit the application accurately, then review the loan agreement for terms, fees, and repayment schedules before signing.

id="understanding-business-loans">Understanding Business Loans

Comprehending business loans is crucial for any entrepreneur looking to secure funding for their ventures. A business loan is an agreement between you and a lender, providing capital that needs repayment with interest. You can use these loans for various purposes, like covering operating expenses, funding expansion, or purchasing equipment.

Business loans come in two main types: secured, backed by collateral, and unsecured, based on your creditworthiness. The approval process often hinges on your credit score, business longevity, and overall financial stability, including cash flow and revenue.

Before applying, verify your business registration in the US is complete, as this can impact your eligibility. Grasping the terms, such as repayment periods that can range from months to years, will help you make informed decisions.

Knowing the specifics of different loan types can likewise guide you in finding the best option for your business needs.

id="types-of-business-loans">Types of Business Loans

When exploring types of business loans, it's essential to recognize the variety of options available to meet your financial needs.

Business lines of credit provide flexible, revolving access to cash, perfect for daily expenses. If you're looking to manage expenses during building credit, consider business credit cards designed particularly for that purpose.

Traditional business term loans offer a lump sum that you repay in fixed increments, making them suitable for larger investments, like expansions. For small businesses, SBA small business loans are government-backed, offering favorable terms and lower interest rates.

On the other hand, merchant cash advances give you upfront capital in exchange for a percentage of future sales. Although this can be a quick funding option, it often comes at a higher cost.

Comprehending these various types of business loans will help you make an informed decision when seeking financial assistance for your business.

id="assessing-your-business-needs">Assessing Your Business Needs

How can you effectively assess your business needs when considering a loan? Start by identifying the specific purpose of the loan. Are you looking to fund expansion, purchase equipment, or cover operational expenses?

Next, determine the amount of funding required by analyzing projected costs to ascertain it aligns with your financial goals. Conduct a cash flow assessment to confirm your business can manage loan repayments comfortably, ideally maintaining income at least 1.25 times total expenses.

Evaluate your current financial health, including annual revenue and credit score.

Consider the type of loan that best suits your situation, whether it's a traditional term loan for major purchases or a line of credit for daily needs.

Be clear about your business goals to guide your decision-making.

id="determining-eligibility-for-a-business-loan">Determining Eligibility for a Business Loan

Grasping your business needs is just the first step in the loan application process; determining your eligibility is equally important. To qualify for a business loan, most lenders prefer a minimum credit score of 690.

If you're figuring out how to start a business in America, bear in mind that your business should ideally be operational for at least 1 to 2 years, though some online lenders may accept those with just 3 to 12 months in business.

HP Launches Next-Gen LaserJet Printers with Quantum-Resistant Security and AI Tools

David Wilson · Small Business Trends

HP has unveiled two new printer series designed to help small and medium-sized businesses (SMBs) effectively bridge the gap between paper and digital workflows while enhancing security. The HP LaserJet Pro 4000/4100 Series and the HP LaserJet Enterprise 5000/6000 Series promise to address the critical needs of businesses looking to streamline operations and protect sensitive data amid rising cyber threats.

“Organizations are under pressure to digitize how work gets done while keeping their environments secure,” said Anneliese Olson, President of Imaging, Printing, and Solutions at HP Inc. This statement reflects the growing urgency among SMBs; a recent report found that 78% face challenges managing hardware and supplies, while 80% plan to adopt or expand print-related software for efficiency.

The LaserJet Pro 4000/4100 Series, tailored for smaller teams, aims to deliver high-quality monochrome printing in a compact design. Its two-sided printing is touted as the fastest in its class, making it an ideal choice for businesses with limited IT resources. The easy setup is complemented by efficient connectivity options, including Wi-Fi 6, which purportedly self-resets for uninterrupted service.

While the focus on security is crucial, HP claims the Pro series is the world's first small business printer to feature quantum-resistant protection. This addition is timely, as cybersecurity experts predict an alarming 34% likelihood of quantum computer attacks by 2034, emphasizing the importance of advanced defenses for SMBs.

The series offers a reported 25% reduction in ongoing print costs compared to previous models, facilitated by HP's innovative TerraJet Toner technology. Environmentally conscious businesses will benefit from energy-efficient designs that showcase certifications like EPEAT Gold, ENERGY STAR®, and Blue Angel.

The Enterprise 5000/6000 Series targets organizations requiring high-speed, dependable performance. Capable of scanning at 200 images per minute (ipm) and printing up to 57 pages per minute (ppm), it supports demanding teams that rely heavily on efficient printing and document digitization. Its built-in smart workflow solutions leverage HP's AI capabilities to enhance document formatting, automate routine tasks, and streamline operations.

Security remains a top concern with this enterprise-grade series. It is powered by HP Wolf Enterprise Security, which is designed to minimize cyberattack risk dramatically. Organizations adopting these printers can maintain compliance and support digital transformation efforts while being aware of potential vulnerabilities.

Both the Pro and Enterprise series promise innovative workflow solutions that simplify management without the need for extensive IT support. Features like automated

guided redaction and advanced optical character recognition (OCR) can save businesses significant processing time, cutting manual steps by as much as 50%.

While the initial adoption of these printers may require a financial commitment, the potential for long-term savings through reduced printing costs and efficient document management could prove beneficial. However, SMB owners should remain aware of possible challenges during the transition, including training staff to utilize new technologies effectively and ensuring the integration of existing systems for seamless operation.

The HP LaserJet Pro 4000/4100 Series is expected to launch in May, with pricing details forthcoming. The LaserJet Enterprise 5000/6000 Series will be available for contract sales starting in March, with broader availability in June.

In an ever-evolving business landscape, HP's new LaserJet offerings aim to solidify the role of printing technology as a vital component of small business operations. For further details on HP's announcements, visit the official release .

Listen to a grieving mother and have no doubts: water privatisation has been a lethal scandal | Clive Lewis

Clive Lewis · The Guardian Environment

Progressives must wage a battle against a rotten capitalist system that milks our resources – and destroys lives. Let the fightback start with water

In more than a decade as an MP, I have attended hundreds of meetings in parliament. Most pass. Some linger. Few stay with you. But a recent event was very different.

We hosted the actors, the real-life people they portrayed and the production team behind the Channel 4 docudrama Dirty Business . It tells the story of campaigners and families who have spent years fighting not just privatised water companies, but a system that was meant to protect them – and has too often failed.

ANALYSIS

The post [How Panic Lost Me Money In A Non-Investment Way](#) appeared first on [Financial Samurai](#) .

Chelsea Kirk, n+1 Magazine: What scares them is something else: the realization spreading across Los Angeles that the private housing market isn't just failing wildfire victims—it's failing by design. That the inability to meet this moment isn't the result of a few bad landlords, it's a feature of a system built to extract. What landlords fear is that we might imagine something better: a world where housing isn't a commodity at all, a world without landlords.

Rachel Khong, n+1 Magazine: “I only love swimming,” I said. And it was true that I’d always felt awkward on land. Sometimes I wondered if that was why I was so unsuccessful at online dating: technology was incompatible with the water. “The monk thing does appeal.”

Olivia Paschal, n+1 Magazine: In retrospect, the week of Donald Trump's inauguration was an inopportune time for Walmart to hold the grand opening of its new corporate campus.

Mark Greif, n+1 Magazine: What is the function of demanding that the entire federal bureaucracy search itself for traces that it might be funding programs to which the Leader might object? Plainly, to dement it. Or make it paranoid, make it pusillanimous, make it humiliated, and bring to the forefront the narcs, toadies, informers, and eager collaborators who can be promoted to replace those who continue their jobs and assert the law.

Helena Horton, The Guardian Environment: Exclusive: critics warn Reform UK use of trade policy would increase food costs amid cost-of-living crisis

Arable farmer and campaigner Clive Bailye has been appointed as a farming and land use adviser for Reform UK. Bailye owns the website The Farming Forum, a social network for farmers, and helped organise the large-scale protests against the Labour government's introduction of inheritance tax for farmed land.

Andrea More, n+1 Magazine: That night I dreamed that my dad had died. The lectern at the service was too high and nobody could see me. I didn't know what to say, so I gave a eulogy about someone I knew a little better who was still alive. When I woke up, my pillow was drenched with sweat. Had my speech been well received? I did some googling and learned that lecterns are between forty-five and forty-eight inches tall. I am nearly a foot taller than that. Thank God.

Lydia Pelot-Hobbs, David Stein, n+1 Magazine: Countless people are left in harm's way because of the state's refusal to make evacuation plans. The hurricane ends up coming through weaker than expected—but then the levees break. Within hours, 80 percent of the city is underwater. ~~The city is hit by a massive storm surge, which causes widespread flooding and destruction.~~
