COVER STORY

Meet Esther Jones, The Black Performer Who Inspired ‘Betty Boop’

When it comes to hidden figures in Black history, few have a legacy as instantly recognizable as Esther Jones.

Bernadette Giacomazzo · All That’s Interesting

A primarily Harlem-based jazz singer known as “Baby Esther” in the early 1900s, Jones became the inspiration for the character of Betty Boop — but never received a penny in compensation.

And, despite her relationship to the internationally-known character, Jones’s life — and death — remain shrouded in mystery. In fact, few recordings of her work remain, and what little is known about her came out in a lawsuit that exposed the real Betty Boop’s true origins once and for all.

This is the little-known true story of “Baby” Esther Jones, the original “Black Betty Boop.”

The Origins Of Esther Jones, The Black Betty Boop

Born in 1919 or 1920 in Chicago, Illinois, Esther Jones was a born performer who first took the stage at age 4. Her parents, Gertrude and William, were her original managers. In her performances, Jones danced, made funny faces, and used the phrase, “Boop, Boop-a-Doop.” But word of Jones’s performances quickly swept New York City, and it wasn’t long before she was performing regularly in the Big Apple.

In 1924, when she was barely 4 years old, Lou Bolton stepped in as her manager, and Jones’ bookings — and profile — increased exponentially. A 1928 article in *Variety* marveled at Jones — by then 7 years old and going by “Baby Esther” — and her performance at the Everglades Nightclub in New York City.

“The child is small for her age and said to be an exceptional black-bottom dancer,” read the report. “The crowd in the place continually applauded the little dancer.”

Jones also had a booking agent named Tony Shayne, who regularly booked another aspiring singer and dancer named Helen Kane. As the Supreme Court of the State of

New York would later find out, Kane was in attendance at the aforementioned Everglades Nightclub performance, where she had front-row seats with Shayne and Bolton.

And Jones’s performance inspired Kane to incorporate it into her own act — an act that would forever be immortalized in the Betty Boop cartoons.

The Infamous Betty Boop Trial

In the 1920s — and beyond — it was quite common for white performers to steal the acts of their Black counterparts without credit or compensation. But, whereas the Black performers of today can rally people to their cause using the power of social media, Black performers of yester-year — like Esther Jones — weren’t quite as lucky.

So, Helen Kane continued to swipe her whole act from “Baby Esther,” and became infinitely more popular than the original. Kane became so popular, in fact, that when the Betty Boop cartoon debuted in 1930, it all but completely mimicked Kane’s style.

And as the cartoon became wildly successful, Kane felt slighted by the “Boop, Boop-A-Doop” — and without a shred of self-awareness or irony, proceeded to file a \$250,000 lawsuit against Max Fleischer, Betty Boop’s creator, just two years after the cartoon vixen debuted on the big screen.

But Kane’s lawsuit ultimately backfired on her, because Bolton — Jones’ manager — was called to testify on behalf of Fleischer and the Paramount Publix Corp. A 1934 article in *The New York Times* reported on Bolton’s testimony,

wherein he stated that he coached “a little Negro girl” to sing the “Boop, Boop-A-Doop” that Betty Boop ultimately made famous.

Interestingly, Kane’s attorney cross-examined Bolton and asked whether “Baby Esther” had been paid for her loss of revenue — and Bolton confirmed that she had not.

Ultimately, the judge ruled against Kane, and she walked away without a dime. Historian Charles Solomon summed up the judgment succinctly: “The Fleischers won the case by proving that a Black entertainer named Baby Esther had previously used the phrase before either Kane or [Mae] Questel [the voice actress who provided the voice for Betty Boop in the original cartoons].”

In other words, Esther Jones was the original Betty Boop.

Baby Esther Lee Jones’ Tragic Anonymity Despite Being The Original Betty Boop

class=“wp-caption-text” id=“caption-attachment-403168”>Wikimedia Commons A photograph, circa 1930, of a woman often erroneously said to be Esther Lee Jones, while very few confirmed photos of Jones herself are known to exist today.

Very little is known about Esther Jones’s life, or her death, after the infamous Betty Boop trial. Many photos alleged to be of “Baby Esther” were actually of other performers named Esther, and “Baby Esther” is most commonly confused with jazz singer Little Esther Phillips.

According to Harlem World , Baby Esther died in 1984 from liver and kidney complications brought on by a drug overdose. But according to Essence , Jones is believed to have died shortly after the Kane vs. Fleischer trial concluded.

Regardless of the truth about Jones’ later life and death, the fact that her story continues to be so obscure in 2021 is a testament to how truly “hidden” she is as a historical figure. Despite being the original Betty Boop — inspiring one of the most enduring cartoons of the 20th and 21st centuries — Jones’ own life is all but an enigma, and neither she nor her family ever received a penny for their contributions.

As of 2021, two subsidiaries of Paramount claim ownership to Betty Boop. Olive Films retains the home video rights to the cartoon, while Trifecta retains the television rights. Vintage Betty Boop items can fetch hundreds of dollars on auction sites, and there are various festivals and cosplay conventions that celebrate the cartoon character.

But none of it would have been possible without Esther Jones, the original Betty Boop, with a voice that reverberates through the ages.

Now that you’ve read the true story of “Baby Esther” Jones, the “Black Betty Boop,” read all about Rebecca Lee Crumpler , the first Black woman to become a doctor in American history. Then, learn all about the tragic story of Juana

Maria , who’s life inspired the classic novel *Island of the Blue Dolphins* .

New/updated studies:

Study: nstd102 (Clinical Structural Variants) Publication: See individual variant records for publications Description: Structural Variants with clinical assertions, submitted to ClinVar by external labs. dbVar now imports all placements from ClinVar as “submitted” and only remaps what is missing in order to place all variants on both GRCh37 and GRCh38. See Variant Summary counts for nstd102 in [dbVar Variant Summary|/dbvar/content/var_summary/#nstd102]. See the latest statistics for nstd102 in [Summary of nstd102 (Clinical Structural Variants)|/dbvar/content/clinvar_summary]. Organism: Human(9606) Study Type: Case-Set Submitter: ClinVar (NCBI) Variant Calls: 65134 Variant Regions: 62722 FTP: https://ftp.ncbi.nlm.nih.gov/pub/dbVar/data/Homo_sapiens/by_study

Study: nstd194 (Lee et al 2020)

Description: To systematically identify non-reference insertion structural variants among human populations, we

developed an insertion detection pipeline, InsetTag, which generates unmapped contigs by local

de-novo assembly and then infers the full-sequence of insertion variants by tracing the contigs

from non-human primates and other human assemblies. By application of the pipeline to 1000 Genomes

Project database, we could identify 1,696 non-reference insertion variants in 2,535 individuals and

re-classify the variants as retention of ancestral sequences or novel sequence insertions based on

the ancestral state. Here, we report 1114 variants which are larger than 100 bp and have genotypes.

See Variant Summary counts for nstd194 in [dbVar Variant Summary|/dbvar/content/var_summary/#nstd194].

Apple's Assault on Standards

Alex Russell (*infrequently noted*)

TL;DR : Market competition underlies the enterprise of standards. It creates the only functional test of designs and lets standards-based ecosystems route around single-vendor damage. Without competition, standards bodies have no purpose, and neither they, nor the ecosystems they support, can retain relevance. Apple has poisoned the well through a monopoly on influence, which it has parleyed into suppression of browser choice. This is an existential threat to the web, but also renders web and internet standards moot. Internet standards bodies should recognise the threat and respond.

The Power of Interoperability

Voluntary Adoption Is Foundational to Internet Standards

How Apple Uses Its Monopoly to Centralise and Enclose

Apple's Transgressions Against Voluntary Adoption

Unilateral Off-Ramps

How Apples Crimes Differ From Prior Episodes

Necessary, Proportional Responses

Why Now?

Do Standards Matter?

Internet enthusiasts of the previous century sometimes expressed the power of code by declaring the sovereignty of cyberspace, or that “code is law.”

As odd as these claims sound today, they hit a deep truth: end-users, and even governments, lack power to re-litigate choices embodied in software. Software vendors, therefore, have power. Backed by deeply embedded control choke-points, and without a proportional response from other interests, this control is akin to state power.

Both fear and fervour about these properties developed against a backdrop of libertarian attitudes toward regulation and competition. Attenuating vendor power through interoperability was, among other values, a shared foundation of collaboration for internet pioneers.

The most fervent commitment of this strain was faith in markets to sort out information distribution problems through pricing signals, ² and that view became embedded deeply into the internet's governance mechanisms. ³ If competition does not function, neither do standards.

The internet's most consequential designs took competitive markets as granted. Many participants believed hardware and software markets would (and should) continue to decouple; that it would be easier for end-users to bring their own software to devices they owned. It is odd from the

perspective of 2025 to suggest that swapping browsers, e.g., should come at the cost of replacing hardware. This is why Apple have worked so hard to obscure that this is exactly the situation it has engineered, to the detriment of users, the web, and internet standards.

Internet standards bodies assumed the properties of open operating systems and low-cost software replacement to such an extent that their founding documents scarcely bother to mention them. ⁴ Only later did statements of shared values see fit to make the subtext clear.

And it has worked. Internet standards have facilitated interoperability that has blunted lock-in, outsized pricing power, and other monopolistic abuses. This role is the entire point of standards at a societal level, and the primary reason that competition law carves out space for competitors to collaborate in developing them. ⁵

But this is not purely an economic project. Standards attenuate the power of firms that might seek to arrogate code's privileges. Functional interoperability enables competition, reallocating power to users. Standardisation is therefore, at least partially a political project; one that aligns with the values of open societies:

We must ask whether ... we should not prepare for the worst leaders, and hope for the best. But this leads to a new approach to the problem of politics, for it forces us to replace the question: “Who should rule?” by the new question: “How can we so organize political institutions that bad or incompetent rulers can be prevented from doing too much damage?”

— Karl Popper, “The Open Society and Its Enemies”

Without a counterweight, network effects allow successful tech firms to concentrate wealth and political influence. This power allows them to degrade potential competitive challenges, enabling rent extraction for services that would otherwise be commodities. This mechanism operates through (often legalised) corruption of judicial, regulatory, and electoral systems. When left to fester, it corrodes democracy itself. ⁶

Apple has deftly used a false cloak of security and privacy to move the internet, and the web in particular, toward enclosure and irrelevance. Cupertino acts as a corrupted, and indeed incompetent, autocrat in our digital lives, even for folks who don't carry iPhones. It accomplishes this trick through abuse of a unique monopoly, allowing it to extract rents, including on the last remnants of open ecosystems it tolerates.

Worse, Apple's centralisation through the App Store entrenches the positions of peer big tech firms, harming the prospects of competitors in turn. Apple have been, over the course of many years, poisonous to internet standards and the moral commitments of that grand project. ⁷

Standards are voluntarily adopted and success is determined by the continuous horse-race coverage in the tech
